

SPECIFICATION KOZ SPECIALS (CUSTOM MADE)

Application: KOZ Products B.V. specials blocks can be designed specifically to your specifications, to provide the best way of fitting low-, medium- and high voltage cables in multiples alongside and in layers above each other.

The high (moulded) density of our material means no air will enter, as occurs with other brands of products made from recycled material.

When there are large quantities involved we may explore the option of creating a mould for mass production.

Range: The specials can be produced in practically any desired cable configuration.

Material: HMPE and/or black polyamide (PA66)

Standards: It is possible to perform a lateral or axial load test according to the International standard NEN-EN-IEC 61914:2016.

Procedures: When starting the process of making a custom made clamp or block, to help solve your technical problem, we need a detailed description of the problem at hand. A detailed drawing would have our preference to avoid misunderstandings.

KOZ Products B.V. will make a final drawing and quotation for approval and will then start the process of making the custom made product.

Further details as pricing and delivery times will be enclosed in the quotation.
